Exploration season is back in Washington County!

LOOK BACK AT 2024

Hercules completed its Phase III exploratory drill program to follow up on our porphyry copper deposit in 2023. Our team **drilled deeper and more precisely to try and pinpoint the heart of the copper system.**

Hercules also completed its Phase I metallurgical testing of those rock core samples. We found:

- *copper* recoveries of 90%
- *silver* recoveries of more than 80%

This key step in understanding the quality of the mineralization shows a **promising potential future for high-quality resource development** in Washington County.

»»» JOB OPPORTUNITIES

We appreciate the interest in jobs with our crew for this upcoming exploration season.

While we currently do not have any open positions, please feel free to reach out for updates on future opportunities.

THE PLAN FOR 2025

Hercules will **continue exploring beneath the surface** to better understand the mineral system and its potential.

IMPORTANT NOTE:

The Hercules Project is *NOT* a mine.

Our team of geologists are explorers. We will be gathering more data and testing new theories via drill pads, field mapping, and geophysical imaging.

We have **several more years of exploration ahead** to fully understand the size, quality, and economic viability of the Hercules Project before any decisions about a potential mine can be made.

»»» IN THE COMMUNITY

We are **committed to supporting our community**, including the organizations that are doing impactful work to assist our neighbors.

We recently presented a donation to LOVE Inc of Washington County.

FAST FACT: What is a porphyry?

A porphyry is a type of rock that often hosts large deposits of copper, gold, or silver. These deposits are typically found in zones where magma has cooled and crystallized underground.
